Acoustic Panels Collection

Design by **Nurus D Lab**

For sound quality and wellness in living spaces.

Acoustical equilibrium is important for health, happiness, and productivity in any space as houses, offices, and classrooms.

We designed Acoustic Panels to improve sound quality and reduce resonance. Common sound problems are caused by sound waves reflecting off walls.

Acoustic Panels mostly use with the low, mid and high frequencies in room and sound absorption. They help you to control and reduce noise and also they are the best way to eliminate junk noise such as echo, reverberation, and resonance.

Acoustic Panels absorb sound waves to reduce noise, clarify speech, and limit reverberation in walls.

Acoustic Panels create more welcoming environments; improve productivity in shared workspaces and open-offices, ease focusing and communication.

The Acoustic Panels fluctuate and wheeled features help you to use different heights and places according to your needs. You can also use them as dividing panels.

Acoustic Panels

Nurus D Lab

The image features three modern, minimalist storage units or shelving systems. Each unit is composed of a dark grey, textured base and a flat top panel. The unit on the left has a dark navy blue top panel. The unit in the center has a light grey top panel. The unit on the right has a teal top panel. All three units are mounted on small, black, four-wheeled casters. The units are arranged in a slightly staggered line against a plain, light grey background.
